

AI Engineering Acceleration

Case study

A SaaS company with 250 engineers moved from zero AI usage to 28% AI-generated code in six weeks. Code review time decreased by 42%.

The challenge

AI-assisted development was appearing as informal experimentation across teams, without shared guardrails, measurement, or a clear quality model. Leadership needed evidence about where AI could create value without compromising security, intellectual property, review quality, or engineering craft.

The approach

Hill-Top Consultancy established a delivery baseline, selected representative pilot teams, designed safe AI workflows, created policies for sensitive code and review ownership, and measured adoption alongside quality and rework signals.

What we delivered

- Discovery interviews and repository analysis
- AI workflow design for coding, testing, documentation, and DevOps
- Pilot enablement across selected product squads
- Review policy, security guardrails, and measurement model
- Scale roadmap for engineering leadership

Outcomes

- 28% AI-generated code in six weeks
- 42% reduction in code review time
- 250 engineers enabled
- A repeatable AI adoption playbook owned by the client
